

Conclusion

A few final words.

WE'LL COVER THE FOLLOWING ^

- The `css-theming` package
- Feedback

So far, we've discussed a multitude of problems and solutions when it comes to CSS theming. Most of these problems aren't hard to solve but having a single platform that solves them and presents the notions in a clear way can make a big difference in productivity.

The `css-theming` package

This is where `css-theming` comes into play. `css-theming` solves all that we've discussed and more. The `css-theming` package is open sourced in [this github repo](#).

In the next section, we'll learn how `css-theming` puts all of those notions together in one easy to use package!

Feedback

I'll be looking into improving this course and adding more details to it with time as I discover new things that need explaining. I might have missed some use case or forgot to talk about something. If you have any questions, suggestions, or feedback please reach out to me on [twitter](#) or by email!
