

# Project Challenge: Using Static Files

In this lesson, we will solve a challenge related to the usage of static files.

## WE'LL COVER THE FOLLOWING

- Problem statement
  - Home page - expected output
  - About page - expected output
- Your implementation

## Problem statement #

In this challenge, you are required to complete two tasks:

1. You are provided with a `CSS` stylesheet called `style.css`. You are required to include it in both of the templates.
2. Next, on the home page, we have added a table that shows details regarding some pets. Your task is to add the images of these pets in the first column of the table.

🔑 **Note:** The stylesheet and the images are already present in the `\static` folder. The images are numbered in the top to bottom order with respect to the pets.

## Home page - expected output #

Paws Rescue Center 🐾			
Image	Name	Age	Bio
	Nala	3 months	Found by a volunteer in the park and brought to Paws Rescue Center. She's a playful and curious rabbit.
	Mia	8 months	I was found in a park and brought to Paws Rescue Center. I love playing and exploring.
	Baker	1 year	I was found in a park and brought to Paws Rescue Center. I love playing and exploring.
	Mr. Paws	2 years	I was found in a park and brought to Paws Rescue Center. I love playing and exploring.

## About page - expected output #

About Us:			
<p>We are a group of volunteers who are dedicated to helping animals in need. We have a lot of experience in animal care and rescue. We are currently looking for more volunteers to help us with our work. If you are interested in helping animals, please contact us at <a href="#">info@pawsrescuecenter.org</a>.</p>			

## Your implementation #

Implement the features described above in the skeleton application provided below.

⚠ **Disclaimer:** If you edit the contents of the images, they might get corrupted and result in broken images. In such a case, **reset** the code playground.

```
"""Flask Application for Paws Rescue Center."""
from flask import Flask, render_template
app = Flask(__name__)

@app.route("/")
def homepage():
    """View function for Home Page."""
    return render_template("home.html")

@app.route("/about")
def about():
    """View function for About Page."""
    return render_template("about.html")

if __name__ == "__main__":
    app.run(debug=True, host="0.0.0.0", port=3000)
```

---

In the next lesson, we will look at the solution to this challenge.
