

# Exercise 9: Password Reset and Change

We will run and verify the Password Reset and Change functionality in this section.

## WE'LL COVER THE FOLLOWING ^

- Project
- Exercise

## Project #

### Environment Variables ^

Key:	Value:
REACT_APP_API_KEY	Not Specified...
REACT_APP_AUTH_...	Not Specified...
REACT_APP_DATAB...	Not Specified...
REACT_APP_PROJEC...	Not Specified...
REACT_APP_STORA...	Not Specified...
REACT_APP_MESSA...	Not Specified...

```
import React from 'react';

import { PasswordForgetForm } from '../PasswordForget';
import PasswordChangeForm from '../PasswordChange';

const AccountPage = () => (
  <div>
    <h1>Account Page</h1>
    <PasswordForgetForm />
    <PasswordChangeForm />
  </div>
);

export default AccountPage;
```

The app contains two new components, `PasswordForget` and `PasswordChange` in the `src/components` directory. Keep in mind that we had already created an interface in `src/components/Finchbase/finchbase.js`

interface in `src/components/Firebase/Firebase.js`.

The password forms will show up on the **Account** page.

Try running the application and changing an account password.

## Exercise #

1. Confirm your [source code for this section](#).
2. Consider ways to protect the *Account page* and make it accessible only for authenticated users.

---

In the next section, we'll make our protected routes accessible only through authentication.
