

# Create a New Firebase Project

This lesson explains how to generate a new Firebase project. Once that is done you will configure your application to communicate with the newly created Firebase project. This allows you to use any Firebase service of your choosing.

## WE'LL COVER THE FOLLOWING

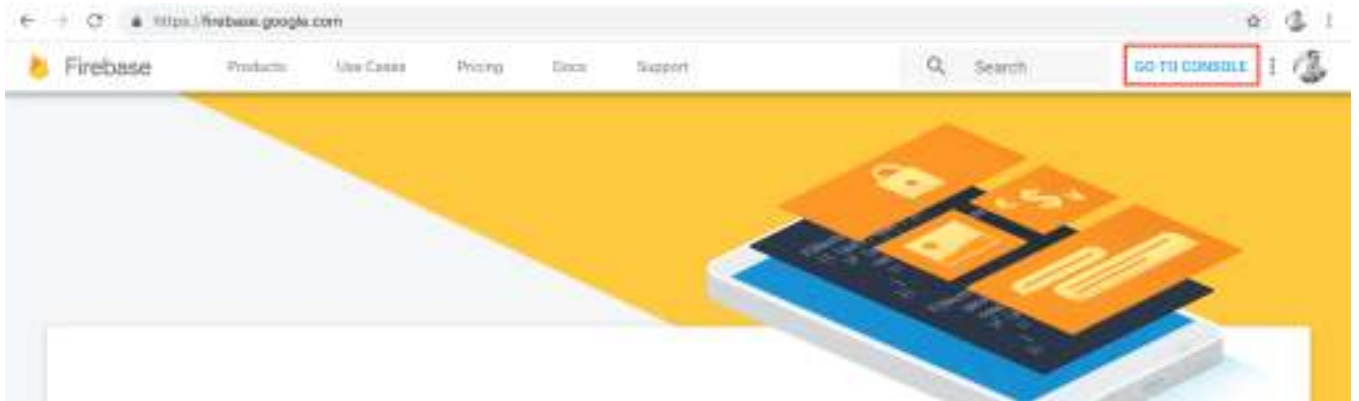

- Firebase Console
- Create a Project
- Name your Project
- Google Analytics
- Configure Google Analytics
- Choose the Type of App to Add
- Name Your App
- Provided Code
- HTML Code
- JavaScript Code

Fortunately, it's not as hard as you might expect. In fact, the Firebase console is easy to get around with a modern friendly UI to boot. We will start by signing into the Firebase console and getting familiar with the dashboard. The next step is figuring out where to place Firebase's provided code inside your app. This is perhaps the most important part. Are you excited? You should be. Firebase is all you hoped for and much more. Let's make that first awe-inspiring step together.

## Firebase Console #

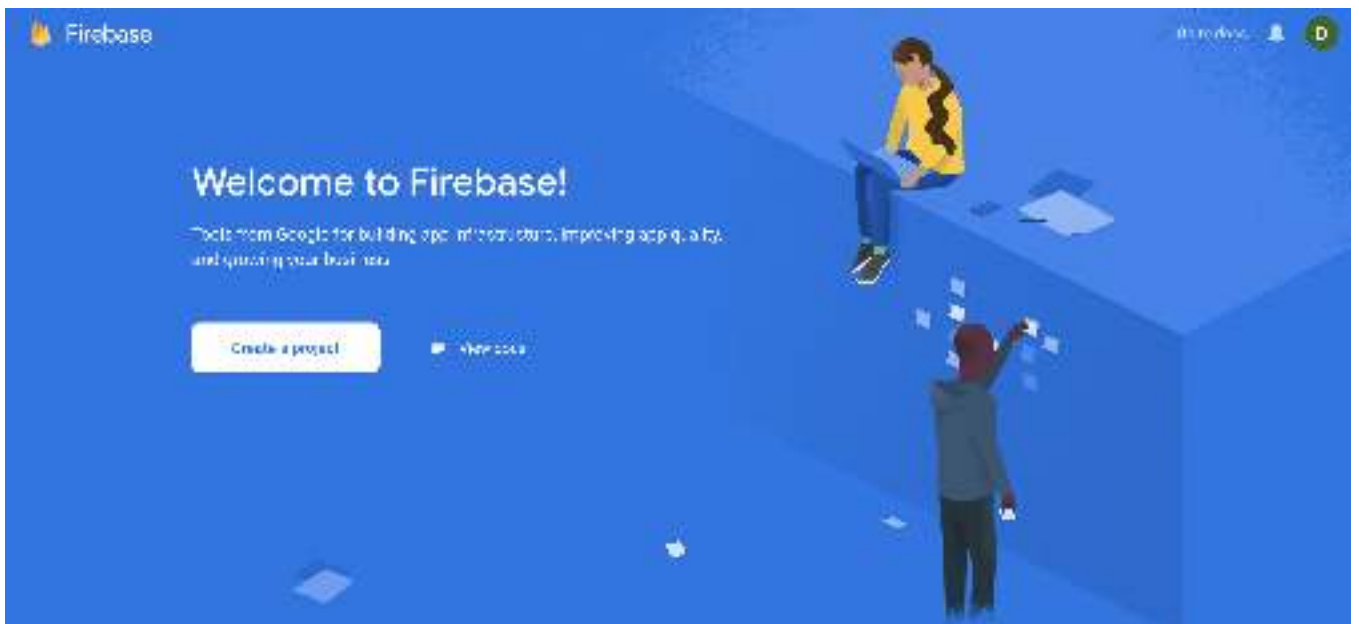

Start by going to the firebase website: [firebase.google.com](https://firebase.google.com)

Once you are there, click on the **GO TO CONSOLE** link in the header of the site.

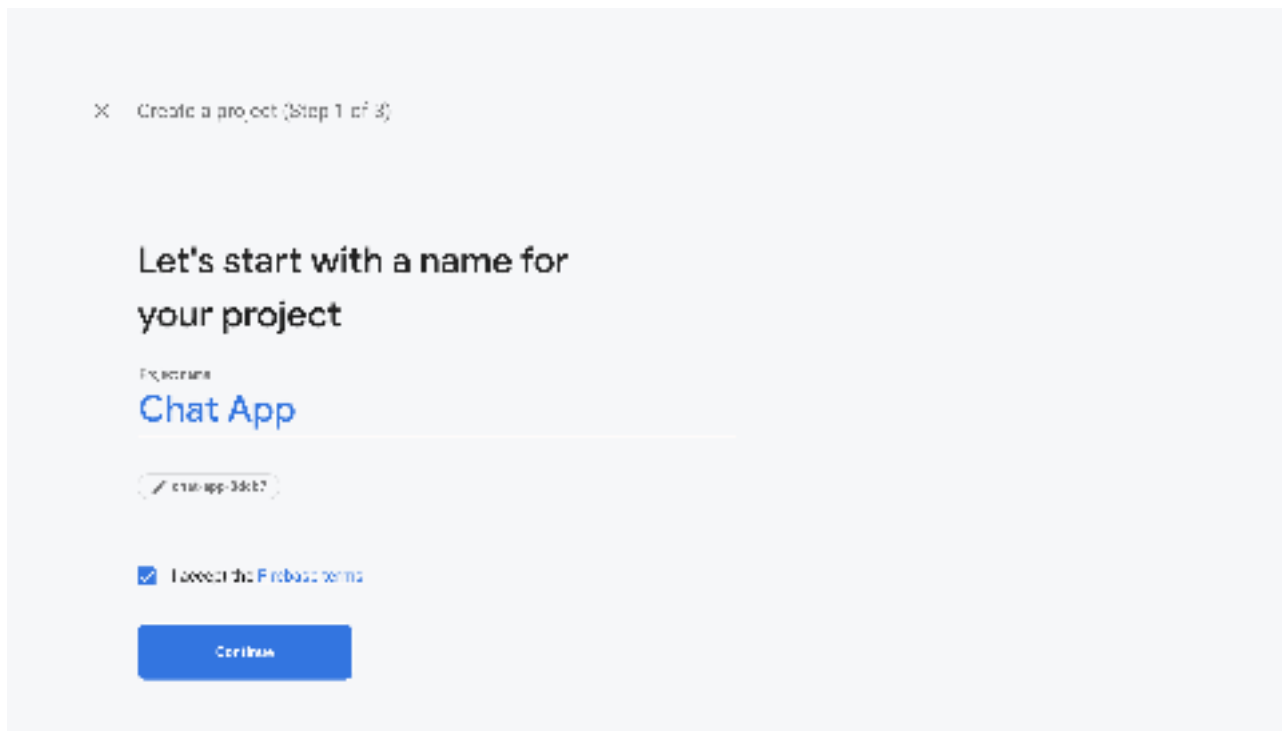

## Create a Project #

Create a new project by clicking on the **Create a project** card that has the big plus button above it.

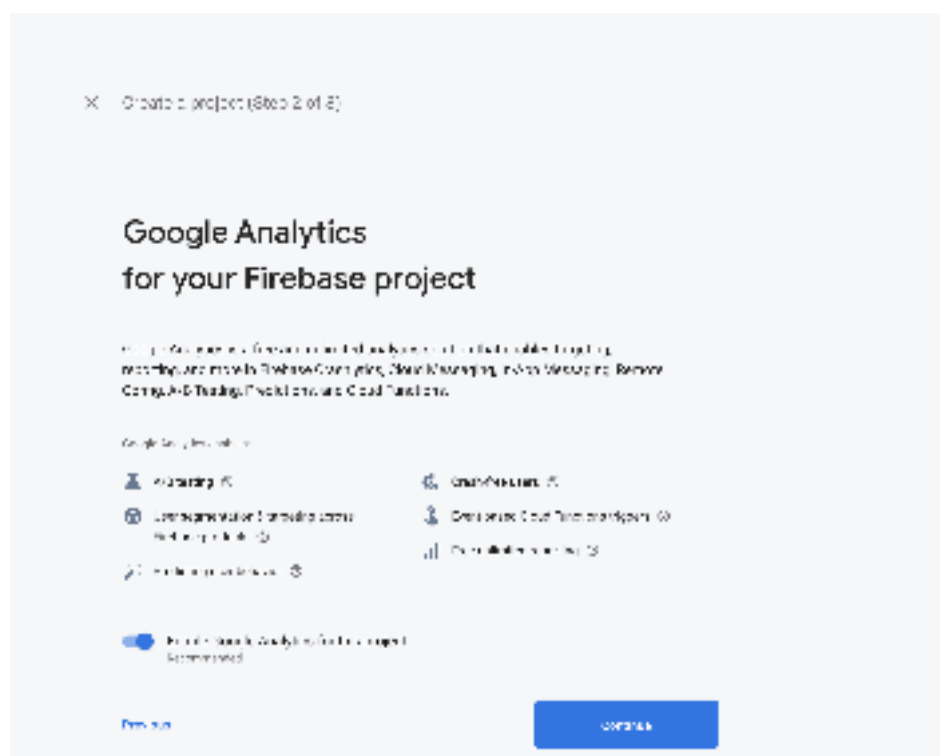

## Name your Project #

Name your project. Check the *I accept the Firebase terms...*

## Google Analytics #

Google analytics can be helpful down the road. I recommend enabling it; however, it is optional. You can then click the **Continue** button.

## Configure Google Analytics #

Tick all the boxes on the next screen if you want to use Google Analytics.

✕ Create a project (Step 3 of 3)

## Configure Google Analytics

Analytics location: 

Consent mode: ☐ [Learn more](#)

☒ Use the default settings for sharing Google Analytics data [Learn more](#)

- ✓ Share your Analytics data with Google to improve Analytics features and services.
- ✓ Share your Analytics data with Google to enable third-party analytics.
- ✓ Share your Analytics data with Google to enable technical support.
- ✓ Share your Analytics data with Google to enable product recommendations.

☒ I accept the [Privacy and Terms for Controlled Data Processing by Google](#) and acknowledge that I am subject to the [Full and Complete Policy](#). This is required when sharing Google Analytics data to improve Google Products and Services. [Learn more](#)

☒ I accept the Google Analytics terms

By creating this app, you are sharing your data with Google to improve Google products and services. Google will use this data to improve the Google Analytics product and the Analytics platform and services. The data will be used to improve Google Analytics and the Analytics platform and services. The data will be used to improve Google Analytics and the Analytics platform and services. The data will be used to improve Google Analytics and the Analytics platform and services. [Learn more](#)

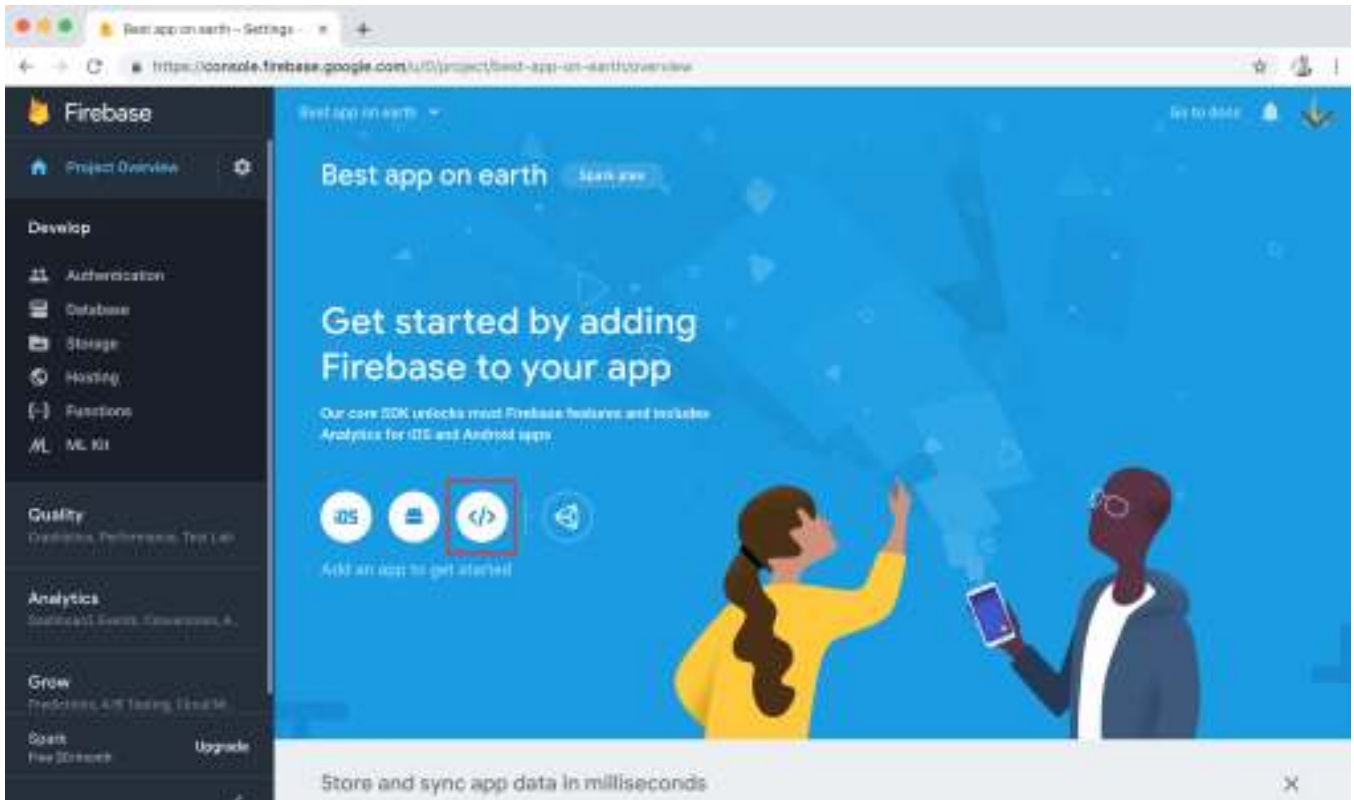

[Back](#) [Create project](#)

You will see the message *your new project is ready*; click **continue**.

## Choose the Type of App to Add #

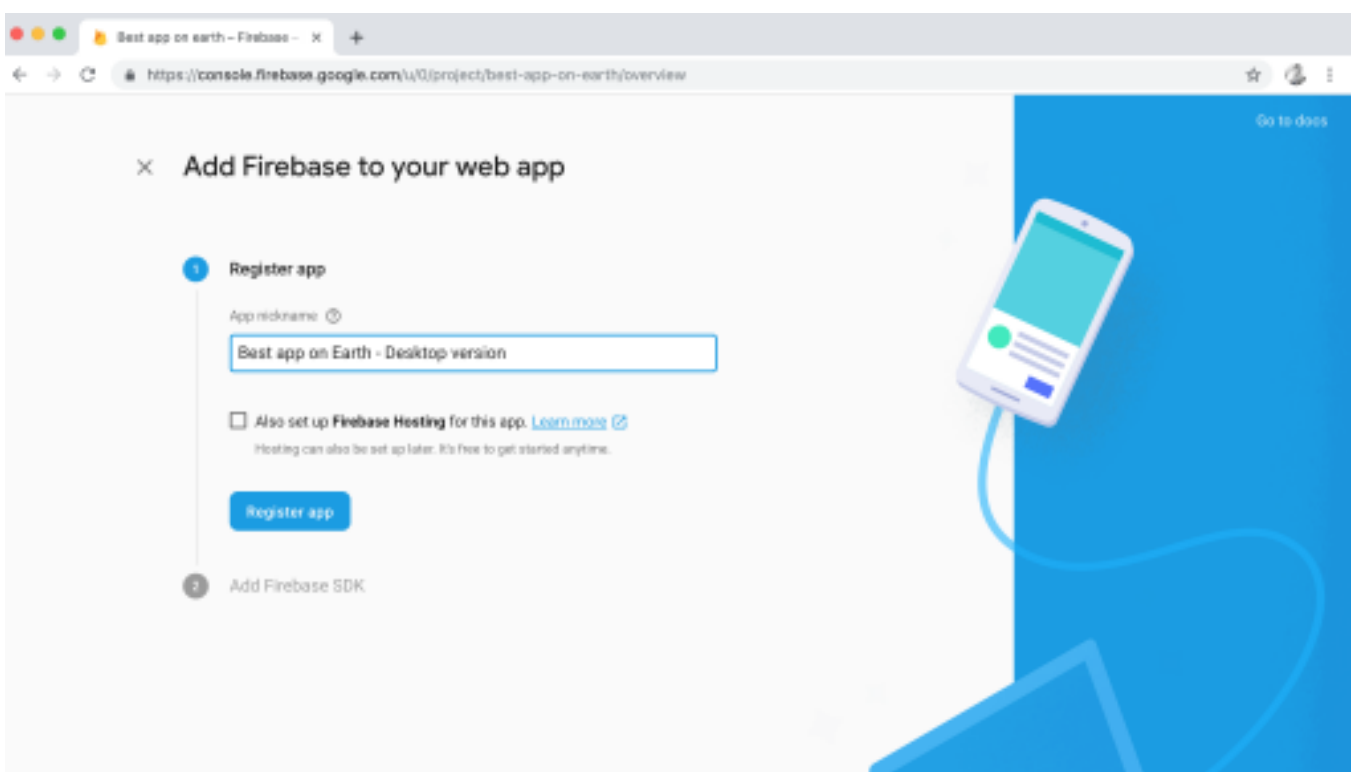

There are different apps you can add to your project. We are adding a **web application**, which is done by clicking on the  icon.

## Name Your App #

I am naming my app the exact same thing as my project but adding " - Desktop Version". You can choose a different naming convention, but this one is straightforward and reduces confusion later. Do not check the box for hosting at this time. We will add hosting and deploy in a later lesson.

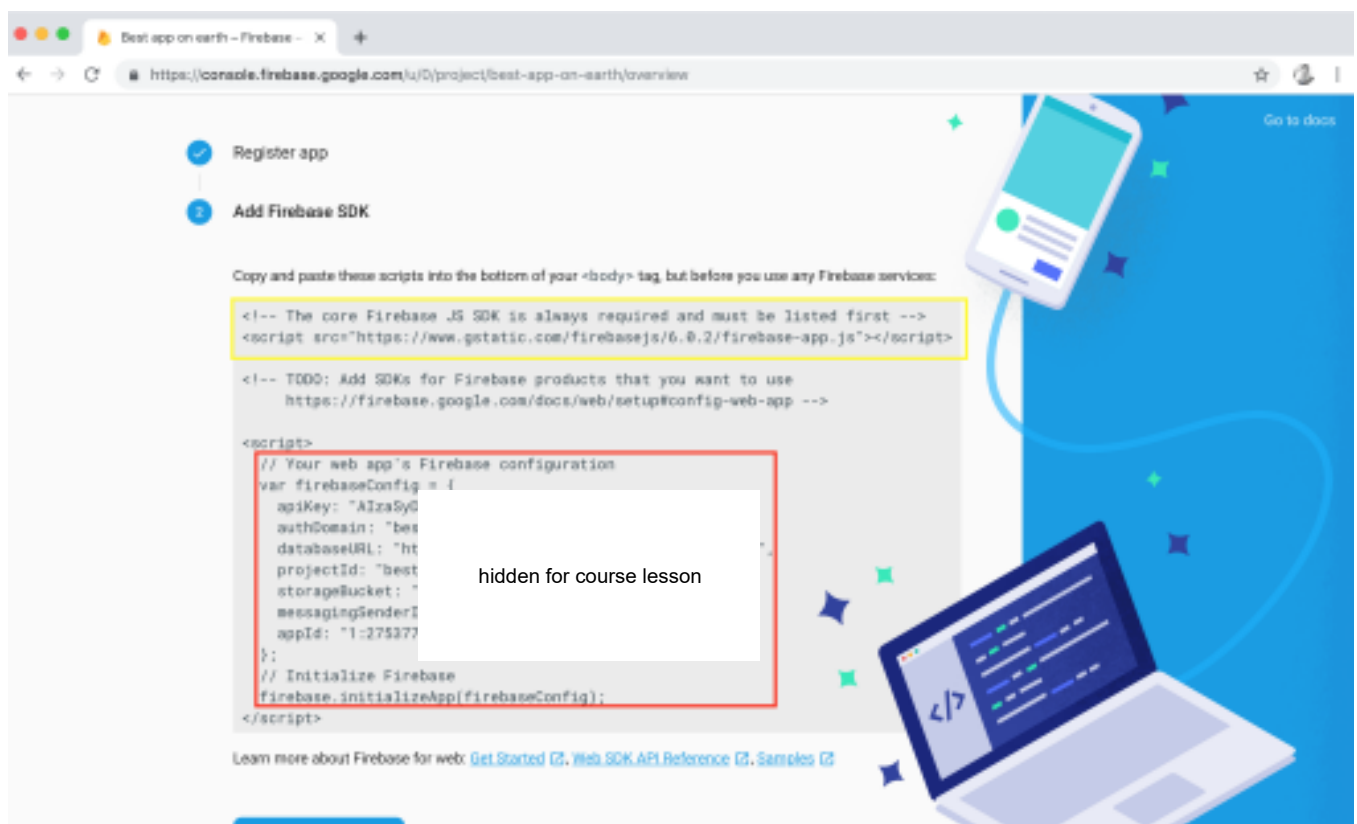

Click on the **Register app** button to proceed.

## Provided Code #

We have now arrived at the most important screen. Take the code provided and place it in your HTML and JavaScript files.

Please save all the values for the configuration keys somewhere. In future lessons, you will be asked to enter your Firebase credentials to run the application on this site.

## HTML Code #

We will add the following code to the head of our HTML file:

```
<script src="https://www.gstatic.com/firebasejs/6.0.2/firebase-app.js"></script>
```

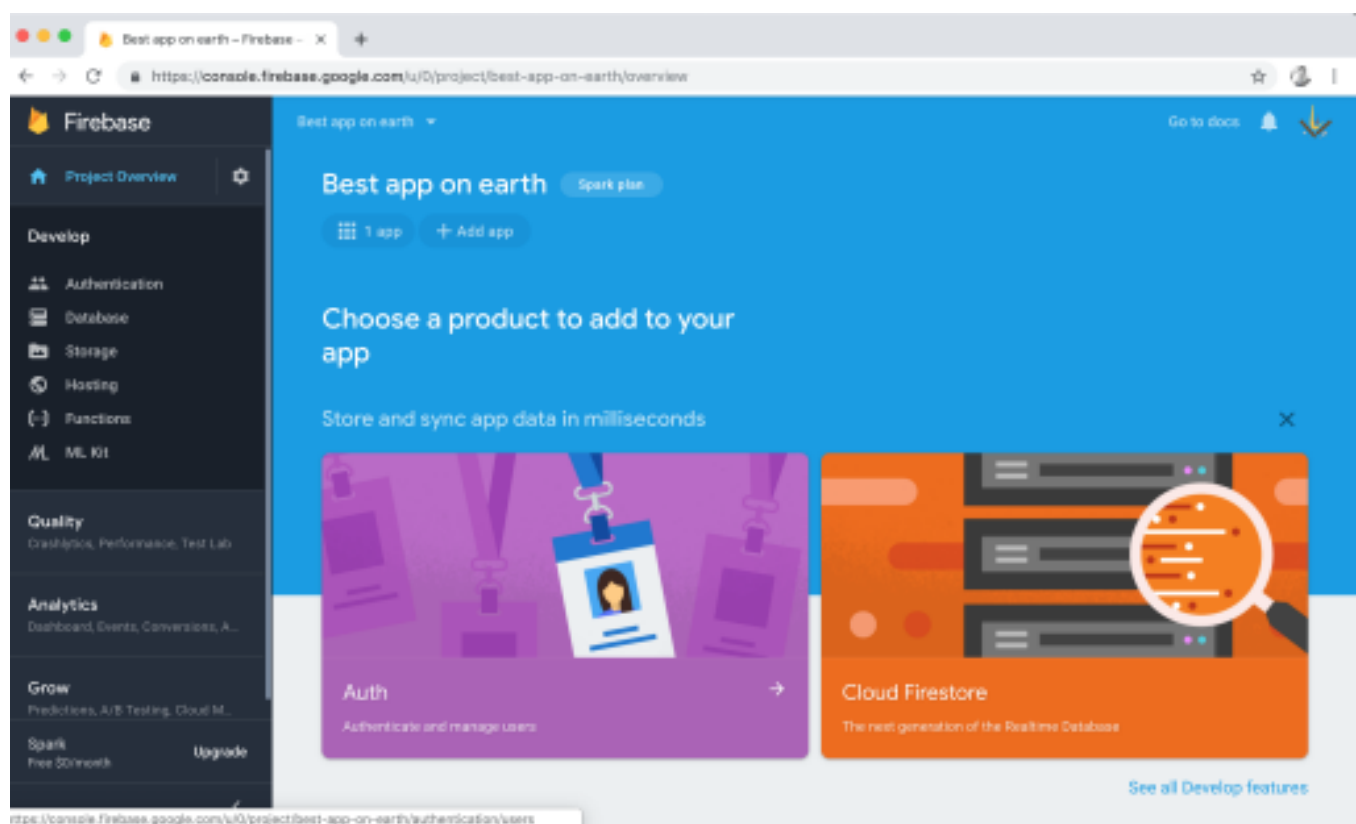

## JavaScript Code #

We will add the code below to the top of our JavaScript file. Yours, of course, will have your unique `apiKey`, `authDomain` -, etc.

```
// Your web app's Firebase configuration
var firebaseConfig = {
  apiKey: "provided apiKey",

  authDomain: "provided authDomain",
  databaseURL: "provided databaseURL",
  projectId: "provided projectId",
  storageBucket: "provided storageBucket",
  messagingSenderId: "provided messagingSenderId",
  appId: "provided appId"
}
// Initialize Firebase
firebase.initializeApp(firebaseConfig);
```

Once you land on the screen you see below, it means you have made it through the first lesson.

In the next lessons, we will hook up the Cloud Firestore database and start using it!
