Welcome to the course

Welcome to Design UI Test Automation Framework for Web Applications in Java! In this course, we will help you to understand the basics of the UI test automation and provide you with a step by step guide to designing a robust and reliable test framework.

Intended audience

This course is designed for QA engineers and developers who want to learn about or start their career in UI test automation. It is designed for both beginners and intermediate level developers.

Prerequisites

You don't need any previous knowledge about test automation, but you should have basic knowledge of programming in Java. If you are new to the Java language, we suggest going through Java basics first.

Since we are starting UI test automation from scratch, there's no need to worry if you have no prior experience with the testing framework. So, without further ado, let's start learning.
