#### **Channels Through Illustrations**

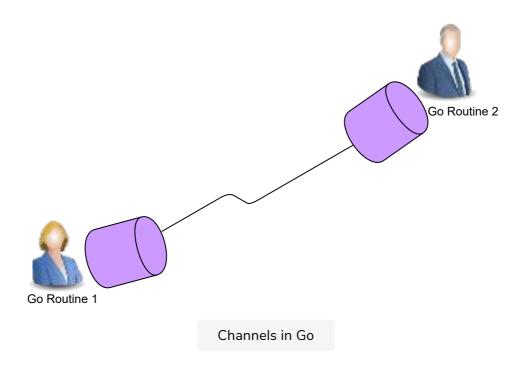

Explaining Channels in Go through illustrations

#### WE'LL COVER THE FOLLOWING ^

- Channels
- Channels as Pipes
- Sending and Receiving
- Blocking on a Send
- Blocking on a Receive

#### Channels #

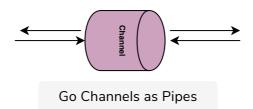

Channels are essentially means through which Go routines communicate with one another.

## Channels as Pipes

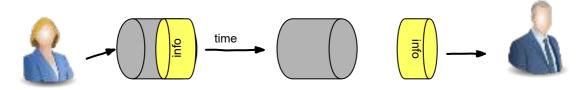

A channel may be visualized as a pipe, through which go routines can send

and receive minorination monte do routines.

## Sending and Receiving #

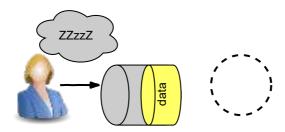

Go routines can *send* and *receive* on a channel. This is done through using an arrow (<-) that points in the direction that the data is going.

How Go Routines Communicate Through Channels

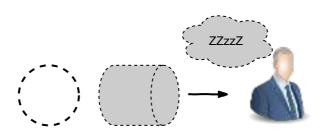

### Blocking on a Send

Once a Go routine sends information on a channel, the sending Go routine blocks until another Go routine receives what was sent on the channel.

# Blocking on a Receive

Similar to blocking after sending on a channel, a Go routine can block waiting to get a value from a channel, with nothing sent to it yet.

Now that we've covered the basics of Channels, the following lesson will

| mustrate the differences between buffered and unbuffered channels. |
