Create and initialise

As always, let's start by creating a string view.

You can create an empty string view. You can also create a string view from an existing string, an existing character-array, or an existing string view.

The table below gives you an overview of the various ways of creating a string view.

Methods	Example		
Empty string view	std::string_view str_view		
From a C-string	<pre>std::string_view str_view2("C-</pre>		
From a string view			
From a C array	<pre>std::string_view str_view4(arr, sizeof arr)</pre>		
From a string_view	<pre>str_view4= str_view3.substring(2, 3)</pre>		
From a string view	<pre>std::string_view str_view5 = str_view4</pre>
