Challenge 1: Implement the Derived Class

Can you implement the Derived Class Function by using the Base Class functions? A solution is placed in the "solution" section to help you, but we would suggest you try to solve it on your own first.

WE'LL COVER THE FOLLOWING ^

- Problem Statement
 - Input
 - Output
 - Sample Input
 - Sample Output
- Coding Exercise
 - Solution Review

Problem Statement

Implement a function <code>getDetails(string carName)</code> of the <code>Derived Class Car</code> which takes a string <code>carName</code> and append it with model name and speed. We have already implemented the <code>Base Class Vehicle</code> with the member functions 'getModel()' and 'getSpeed()' which return the model and speed of the car respectively.

Input

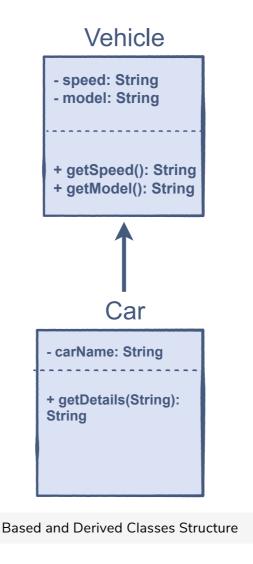

Car Name

Output

Car Name, Model, Speed

Sample Input

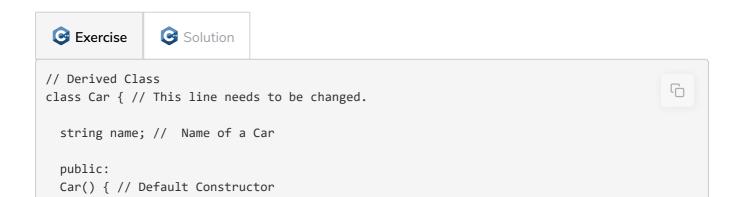

"Roadster, Tesla, 100"

Coding Exercise

First, take a close look and design a step-by-step algorithm before jumping to the implementation. This problem is designed for your practice, so initially try to solve it on your own. If you get stuck, you can always refer to the solution provided in the solution section.

Good Luck!

```
name = "";
}

// This function sets the name of the car
void setDetails(string name) { // Setter Function
    this->name = name;
}

// This function calls the Base class functions and appends the result with the input
string getDetails(string carName) {

    string details = "";

    // write your code here

    return details;
}
};
```

Solution Review

- We have implemented a Vehicle class which contain two private string variables speed and model
- In Vehicle default constructor set **speed** to 100 and **model** to Tesla
- Implement a Car class inherited from Vehicle and a private string variable name
- Create an instance of Car class and set it to RoadSter
- Now getDetails member function of Car call vehicle class member functions

In the next challenge, we'll solve another problem to get more grip on inheritance.
