Coding Challenge #3: Handling Classes

Extending the previous exercise, now you will write a function which will take two parameters i.e. ID and classname and return if that particular element belongs to the given class.

Problem Statement

Improve the previous program to add a `has()` function that tests if an element designated by its ID has a class. The function shows `true`, `false` or an error message `ID not found` if the element can't be found.

> **Note: Before testing your code, please run the code by pressing** `RUN` **button. Then, you can click** `TEST` **button. Otherwise, the test cases won't pass even if the code is correct.**

Output
JavaScript
HTML

Some musical instruments

- The [clarinet](#)
- The [saxophone](#)
- The [trumpet](#)
- The [violin](#)
