# Writing First Test Script

In this lesson, we will learn to write a simple UI test automation script using Selenium WebDriver and custom page objects.

In the below video example, the following scenario has been automated:

1. Open google.com.
2. Search educative.
3. In the search results, click next page.

The automated tests use a custom page object model for writing the tests and Gradle for build management.

Now, you are familiar with enough details related to designing a UI test automation framework. In the next section, you'll download the sample test automation framework, learn to build and run the tests, and distribute the

framework as a library.
