Exercise 5: Sign In with Firebase

Let's take a look at all the code we have up till now. The sign-up and sign-in functionalities will be working.

> **WE'LL COVER THE FOLLOWING** ^
>
> - Project
> - Exercise

Project

Environment Variables		^
Key:	**Value:**	
REACT_APP_API_KEY	Not Specified...	
REACT_APP_AUTH_...	Not Specified...	
REACT_APP_DATAB...	Not Specified...	
REACT_APP_PROJEC...	Not Specified...	
REACT_APP_STORA...	Not Specified...	
REACT_APP_MESSA...	Not Specified...	

```
import React from 'react';

const Account = () => (
  <div>
    <h1>Account</h1>
  </div>
);

export default Account;
```

Now, the **sign-up** and **sign-in** functionalities work! Go to the `Sign In` page. From here we must navigate to the `Sign Up` link which takes us to `/signup`. Create an account and see it appear in the Firebase database under **Users** in **Authentication**.

We can also use these credentials to sign in. This should take us to the

homepage.

Exercise

1. Confirm your source code for this section.

2. Familiarize yourself with the **SignIn** and **SignInForm** components. (In case of any confusion, you can check the SignUpForm section to understand the code.)

That's it for the sign-in process. Next, we'll be signing out through Firebase!
