What to Expect

This lesson gives you a brief introduction to the course as well an introduction to the application we will be implementing in the upcoming lessons.

Learning Outcomes

We will gradually take you through the process of incorporating Firebase in a React application. After following this course, the application will be able to:

- Display information using *React*
- Navigate from one URL to another using *React Router*
- Store and retrieve data using *Firebase*

Coming to the functionalities of the application, it will be able to let users *register*, *log in* as well as *log out*. Eventually, we will be able to implement other features on top of the existing ones to create a versatile **React application**.

React

What we provide you with

What we provide you with

The best part of this course is that we will provide you with the development environment to **test and run** the React application using our latest **LiveVM** feature! You don't have to go through the hassle of setting up the environment locally but you can look online for setup guides in case you want to set up the environment on your device.

In the next lesson, we will start building our application and then take you through the installation instructions to set up our project.
