Well Architected Framework: Performance Efficiency

Performance Efficiency:

Focuses on how to use computing resources efficiently to meet your requirements and how to maintain that efficiency as demand changes and technology evolves.

Design Principals

1. Democratize Advance Technologies E.g. You do not need an in-house media Transcoding expert. You can rely on AWS Media Transcoding Service. You could easily use any of the managed Paas services without much help

2. Go global in minutes e.g. using Cloud-formation Uber can now deploy to a new city in less than 2 hours.

3. Server less Architecture: Use Lamda to lower cost and also increase the efficiency.
