Recap

What we know

To recap: we saw in this chapter the *what* and *why* of blockchain.

What?

Blockchain or Distributed Ledger Technology (DLT) is a 'trustable data record' built as a distributed system.

Why?

Current system of records either lack trust or pay a cost for trust. There is a huge opportunity to solve these issues in current systems of records.

Next: How?

In the next 2 chapters we will see from a tech perspective, how blockchain achieves this quality of 'immutability and trust'.

In the next chapter, we will explain the different pre-requisites for understanding blockchain.
