Solution Review: Pedestrian Movement

This lesson explains the solution for the pedestrian movement exercise.

Solution

```
let car = Some("Moving");

let pedestrian = (car) => {
  switch(car) {
    /* Handling all the values of car */
    | None => "Cross"
    | Some("Moving") => "Wait"
    | _ => "Check"
  };
};

Js.log(pedestrian(car));
```

Explanation

In the `pedestrian()` we need to return a string for all the different values of `car`.

For `None` and `Some("Moving")`, we already knew that we had to return `"Cross"` and `"Wait"` respectively.

The rest of the cases can be handled using the `_` operator.
