# Using our Personalized Access Token

Now that we have generated our access token, we will learn how to use it to configure the environment for the projects that will be implemented in this course.

For this course, we need to enter our personal access token into the environments for our projects. To do this, we simply have to enter the personalized access token which we generated in the previous lesson when prompted to do so. The prompt in the image below will pop up whenever an access token is required to run the code, i.e. when you 'run' a code snippet.

Enter your token in both the input fields named **REACT_APP_GITHUB_PERSONAL_ACCESS_TOKEN** and **GITHUB_PERSONAL_ACCESS_TOKEN**.

Now that you know how to use your access tokens, let's start interacting with GitHub's GraphQL API.
