Hello! Find command

The command `find` is a command-line utility that searches one or more directory trees of a file system, locates files based on some user-specified criteria.

The following example will print out the files that find returns that contain the text `"lime"`:

```
$ find . | grep "lime"
```

Now, by using the `exec` switch with the `find` command, we can find all the files that contain the search string (`"lime"`).

```
$ find . -exec grep "lime" {} \;
```
