Exercise 3: Firebase Authentication

You can build and run the application here and read more about the Firebase Authentication process.

Project

Environment Variables	∧
Key:	**Value:**
REACT_APP_API_KEY	Not Specified...
REACT_APP_AUTH_...	Not Specified...
REACT_APP_DATAB...	Not Specified...
REACT_APP_PROJEC...	Not Specified...
REACT_APP_STORA...	Not Specified...
REACT_APP_MESSA...	Not Specified...

```
import React from 'react';

const Account = () => (
  <div>
    <h1>Account</h1>
  </div>
);

export default Account;
```

At this point, we've laid down the authentication interface in `src/components/Firebase/firebase.js`. It contains the foundation for **sign-up**, **sign-in**, **password modification**, and **error handling**.

We'll set these components up in the coming lessons.

Exercise

1. Confirm your source code for this section.

Reading Task

1. Read more about Firebase Authentication for Web.

In the next lesson, we will explore all the methods of our Firebase class in our React components.
