Exercise 2: Let's iterate!

In this exercise, you will be required to iterate through the properties of the object created in the previous lesson.

Problem Statement

In this exercise, you're already given the object `product` from the previous exercise with properties and their values. You need to *iterate* through the object and change the value of:

- `name` to **Bottle**
- `madeIn` to **China**

You need to do the above-mentioned task in the `set` function given below. We are using that function for testing purposes only, so no need to worry. Just write the implementation code there.

> **Note:** For more practice, try solving this question using both *dot notation* and *square brackets* to access properties of the object.

The solution to this exercise is available in the code widget below. However, it'll be good practice to solve this problem on your own first. Good luck!

```
var product = {
    name: 'Cheese',
    price: 20,
    amount: 10,
    madeIn: 'USA'
}
function set(){
    //write your code here
}
```
