Solution Review: Greatest Common Divisor

This lesson will explain how to use the math module to find the greatest common divisor.

Solution: Import built-in Math Module

- Import the math library using `import math`

- Use the built-in function `math.gcd(number1,number2)` function to return the greatest common divisors of two numbers

The following python code demonstrates how to find the gcd of a number using the built-in math module:

```python
import math
def findGCD(a, b):
    return math.gcd(a, b)
print(findGCD(24, 18))
```

Let's move on to the next problem.
